PREFACE

We are proud to present the proceedings of iiWAS2013 in Vienna, Austria. In these proceedings, you will find 113 papers accepted at the 15th International Conference on Information Integration and Web-based Applications & Services. The acceptance rate for full papers was around 30%.

For this preface, we chose five papers that exemplify the wide range of topics addressed at the conference. From the Semantic Web to object-oriented frameworks for web Services, from social media and opinion-mining to e-commerce, these papers touch upon only a few of the many topics discussed at iiWAS2013.

In the paper “Formal Linked Data Visualization Model”, Brunetti et al. contribute to the growing field of data visualization, which allows non-expert users to explore the Semantic Web. Their model makes dynamic connections between different data using a library of generic visualizations. Like so many recent developments, it is useful both for users and for data analysts, as it can also be used to make detailed analyses of Linked Data.

Another area where the boundaries between users and researchers become blurred is that of social media. In “Two Phase Extraction Method for Multi-label Classification of Real Life Tweets”, Yamamoto & Satoh describe how they developed a system for classifying tweets of real-life relevance (such as train delays or locations of food and water during an earthquake) into multiple categories so as to increase their usefulness for other users. Due to the typically short sentences used in Tweets, the usual mining approaches cannot be applied, so their method derives the associations and labeling rules from a smaller set of manually labeled tweets.

The extraction of meaning is also the topic of Dinsoreanu et al. “A scalable approach for Contradiction Detection driven by Opinion mining”; however, their focus is on detecting contradicting opinions. Their method extracts opinions from natural language documents, such as news, reviews, etc., and detects inconsistencies – i.e., contradictory opinions expressed by one or several people. They also identify communities based on matching opinions and social data, and can track changes in opinion over time.

In “Good&Service Bundles and B2B E-Commerce by Global Narrow-Specialized Companies”, Fauska et al. address the question of how e-commerce can be used profitably by highly specialized companies, which often dominate their niche markets. In contrast to large multinationals, which have a broad customer base and a worldwide reputation, niche companies have a limited customer share and are hardly known outside their field of specialization. While many of these companies recognized the value of e-commerce very early in the 2000s and have a good reputation, their solutions are often so highly specialized that it is hard to acquire customers without direct customer contacts. The paper discusses these issues on the example of a case study and formulates some interesting questions for future research.

Moving from e-commerce to Web services, “The Substitution Principle in an Object-Oriented Framework for Web Services: From Failure to Success” by Allam et al. discusses issues in the specification of object-oriented frameworks and suggests that solutions used in other areas should be applied there as well: A loose coupling of the service and object layers would allow changes in the service layer with only a minimal impact on the object layer, while introducing interoperability induced by the substitution principle would make it possible to convert subtype values into supertype values. They find that the cxf framework has some coupling and interoperability issues caused by the failure of the substitution principle and propose a new specification for the framework.

While these five papers represent only a few of the many topics addressed in this volume, we hope that this introduction has given you a glimpse of the wide range of papers and whet your appetite for more.
